# Literature Review for Winter Project 2024-25

**Name:** Yashi Desai
**Roll No**: 3133
**Area of Specialisation:** Marketing
**Title of Topic:** A study on impact and consequences of selective marketing on gen z for gaming industry in Surat city.
**Guide Name:** Prof. Dr. Mehul Ganjawala

| Sr No. | AUTHOR/S' NAME (YEAR) | Topic/Objectives of the study | Country/City/ Region | Research Methodology (Mention each Particular) | Variables/Factors/ Characteristics | Data Analysis Methods | Major Findings (Based on Objectives) | Conclusion | Critical Remarks (Gap) |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 1) | Adiguzel, S. (2024) | The effect of in-game advertising as a marketing technology on the purchasing behaviour on gen z | Turkey | Survey-based Research, Experimental Research | In-game advertising, Gen Z attitudes, Purchase intention, Brand recall, Gaming habits | Descriptive statistics, Correlation analysis, ANOVA (Analysis of Variance), Regression analysis | Gen Z is highly influenced by in-game ads, especially when they are interactive. Increased brand recall and higher purchase intention were observed in games with integrated ads. | In-game advertising is effective for influencing Gen Z purchasing behavior, particularly when ads are seamlessly integrated into the gameplay. | Limited sample size, focus on one genre of game, regional biases. |
| 2) | Lin, Z. and all (2020) | Gamification and online impulse buying: The moderating effect of gender and age | China | Online Survey (questionnaire), Descriptive Study | Gamification, Online impulse buying, Gender, Age, User engagement, Emotional response | ANOVA, t-tests, Interaction effects | Participants exposed to gamified e-commerce sites showed increased impulse purchases, especially among younger adults. | Gamification significantly influences impulse buying online, with gender and age moderating the effect. | Gender and age differences are not fully explored across different types of gamification (points, badges, leaderboards). |
| 3) | Manuela, A. and all (2021) | Gamification and reputation: key determinants of e-commerce usage and repurchase intention | Portugal | Experimental Research | Gamification features (leaderboards, rewards), Reputation (user reviews, brand trust), Purchase behavior | ANOVA, t-tests, Interaction effects | Participants who engaged with gamified e-commerce platforms were more likely to make a purchase and repurchase. | Positive reputation and gamified features work synergistically to encourage both initial and repeat purchases in e-commerce. | Limited to experimental settings; may not fully reflect real-world e-commerce scenarios. |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| 4) | Lina Fatini, A. and all (2021) | Gamification elements in E-commerce - A review | Malaysia | Longitudinal Study | Gamification (rewards, levels, badges), Consumer retention, Repurchase intention, User behavior | Regression analysis, Time-series analysis | Over time, exposure to gamified systems led to increased repurchase intentions and customer retention. | Long-term exposure to gamification fosters loyalty and improves repurchase intention. | Short-term focus in some cases; a more extended period of study is needed to assess the durability of effects. |
| 5) | Liuyufeng, L. and all (2023) | Gamification enhances students intrinsic motivation, perceptions of autonomy and relatedness, but minimal impact on competency | Hong Kong, China | Mixed Methods Approach | Gamification (game mechanics, feedback loops), Intrinsic motivation, Autonomy, Relatedness, Competency, Student achievement | Qualitative interviews, SEM, Regression analysis | Gamification did not strongly affect students' perceived competency, with some students feeling less competent due to perceived competition. | Gamification increases intrinsic motivation and perceptions of autonomy and relatedness, though its effects on competency are minimal or mixed. | Small sample size and lack of diversity in academic backgrounds may limit generalizability. |
| 6) | Karmazinova , V. (2024) | Gamification of consumer loyalty programs | Ukraine | Survey research with online questionnaires | Consumer behavior (spending, retention), loyalty, engagement, satisfaction | T-tests, Regression analysis | Gamified loyalty programs lead to higher retention rates and increased consumer spending compared to non-gamified programs. | Consumers respond positively to gamified elements, which enhances program effectiveness. | The study lacks diversity in sample demographics, potentially limiting its generalizability. |
| 7) | Tai, H. Thanh Tu, T. (2023) | Impact of gamification on Genz impulse buying behaviour | Vietnam | Mixed-Methods (Survey + Focus Groups) | Gamification Elements (Points, Badges, Leaderboards, etc.) | Structural Equation Modeling (SEM) | Gen Z's perception of value influences how gamification affects purchase intent. | Gen Z’s engagement with gamification significantly boosts impulse buying, but their perception of value is crucial. | The role of social media as a gamification platform was not fully explored. Limited generalizability due to small sample size. |
| 8) | Gan, S. (2024) | Innovative digital marketing strategies in the gaming industry: A case study of love and deep space | China | Case Study (Qualitative Analysis) | Digital Marketing Strategies, Game Design Features, Audience Engagement | Content Analysis, Statistical | Both *Love* and *Deep Space* effectively use digital storytelling and community engagement to captivate players. | Innovative digital marketing strategies like social media campaigns, in-game events, and influencer partnerships helped retain a loyal gaming audience. | Lack of quantifiable metrics for measuring the long-term effectiveness of these strategies. |
| 9) | Zhang, Z. (2023) | Research on the development of recent game market | America | Quantitative Survey (Cross-sectional) | Game Market Trends, Consumer Behavior, Game Platform Preference | Descriptive Statistics, Regression Analysis | Mobile gaming dominates the current game market, especially among younger demographics. | Mobile and cloud gaming are expected to continue dominating the market, with younger audiences driving these shifts. | Focused mostly on consumer behavior without assessing game development trends or market supply-side factors. |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| 10) | Antonaci, A. (2019) | The effects of gamification in Online Learning Environments: A systematic literature review | Heerlen, The Netherlands | Qualitative Research (Interviews/Focus Groups) | Learner Perceptions, Engagement Levels, Motivation Types | Content Analysis | Students reported increased engagement and motivation when gamification elements (e.g., badges, achievements) were aligned with personal goals. | Gamification can improve engagement, but its success depends on aligning elements with learner preferences and goals. | Limited to a small sample of students, which might not reflect the broader online learner population. Needs more diverse participant groups. |
